

MegaPath's Managed Retail Solutions

MegaPath is the leading provider of network solutions for retailers. MegaPath was the first Managed Service Provider to obtain PCI (formerly CISP) certification of its core network and has maintained compliance ever since. MegaPath operates its own nationwide MPLS fiber optic network which is interconnected with numerous DSL, Cable and Wireless access providers. This multi-access approach allows MegaPath to offer its retail customers the best-fit, lowest-cost access technology at each of its sites to ensure complete coverage.

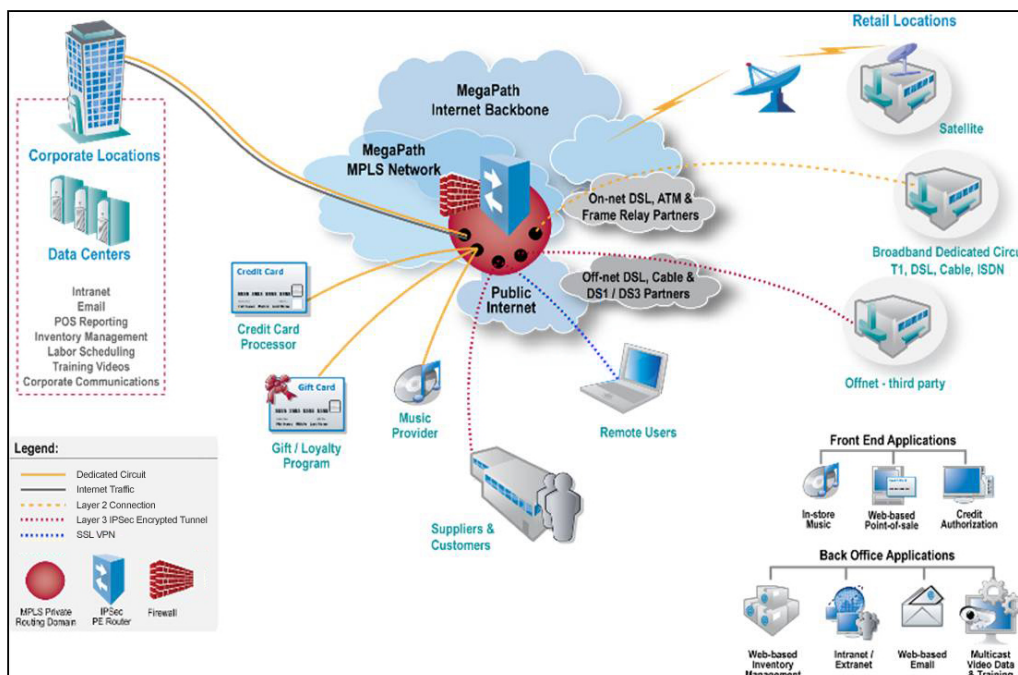

The MegaPath Retail Network provides PCI compliant security for credit card transactions and support for data communications for key retail applications, including point-of-sale, back office systems, training, and digital video surveillance. In addition, MegaPath enables retailers to converge traditionally separate voice and data lines over one high speed connection with MegaPath Hosted Voice over IP service. MegaPath also provides a comprehensive suite of security services, including Managed Firewall and Digital Certificates/PKI to protect retailer's credit card data and network resources. This portfolio of network and security capabilities combined with our engineers' technical expertise enables MegaPath to custom design flexible IP VPN solutions tailored to our retail customers' exact requirements.

Future-Proof Your Network with MPLS & PCI Compliance

With MegaPath's PCI compliant Retail Network, retailers receive multiple layers of security; including physical, personnel, systems, network, and application security to maintain a PCI compliant Wide Area Network. MegaPath Managed Security Services (MSS) also provide retailers with best-of-class security protection without the capital cost and staffing costs of deploying and managing a hardware firewall at each location. And unified threat management ensures zero-hour protection 24x7. As a result, retailers can remove their Wide-Area-Network (WAN) from their overall PCI Compliance concerns. MegaPath's Payment Processor Extranet also provides private network connectivity to major processors of transaction data, completely removing sensitive card data from the public Internet.

MegaPath's MPLS network is ideal for retailers with existing or planned disaster recovery centers, enabling full mesh from primary data centers and data recovery centers to all stores. And QoS prioritization enables mission critical and performance-sensitive applications such as credit card processing, voice, and video surveillance to be given priority routing on the network.

Retail Site-to-Site MPLS/IPsec VPN

MegaPath Managed Retail Solutions include the following:

- **Broadband Connectivity**

MegaPath offers the widest broadband options available today, including ADSL, SDSL, T1, wireless, cable, DS3, Ethernet and satellite.

- **MPLS VPN**

MegaPath MPLS VPN enables retail locations to securely communicate with headquarters and any other necessary locations.

- **Converged Voice and Data**

MegaPath Hosted Voice + MPLS service enables customers to replace costly phone lines with one converged high speed connection which handles both the retail VPN network and voice service. This service is compatible with analog, PBX and IP-PBX phone systems, so there's no new equipment to buy. And, it includes business calling features and QoS prioritization to guarantee voice quality, and a single bill for both voice and data.

- **Managed Security Services**

MegaPath offers a full-suite of hosted Managed Security Services that promote PCI compliance without the need to purchase any additional hardware. This integrated, multi-layered security approach protects your network around the clock. And, a Virtual IP Service enables secure remote access to your video surveillance system to help you protect your business.

- **Payment Processor Services**

The MegaPath Payment Processor Extranet service provides retailers with a PCI compliant private network connection to a wide variety of Payment Processors covering credit/debit/gift cards and other financial transactions.

- **Failover Connectivity**

Minimize business impact due to unexpected broadband outages. Dial-up and wireless backup enable reliable payment processing and ensure applications run at broadband rates during times of primary network outages.

- **Retail Site SSL**

With MegaPath Retail Site SSL, retailers can now easily, securely, and cost effectively manage operations remotely. This service provides a secure connection from any Web browser to your systems, allowing you to quickly access point-of-sale (POS) solutions and back-office PCs.

- **Managed Wireless Local Area Network (WLAN)**

MegaPath WLAN service enables private wireless access to all of your LAN and WAN resources from any wireless device, including hand-held point-of-sale systems and laptops.

- **Video Surveillance**

MegaPath Managed Solutions for Retailers support a wide range of video surveillance systems to give you remote access to high-quality images at your business locations.

- **Syslog and Event Logging**

MegaPath WLAN service enables private wireless access to all of your LAN and WAN resources from any wireless device, including hand-held point-of-sale systems and laptops.
